PHP Glass Website: Frontend Design Brief

Purpose and goals

The PHP Glass website must make a visitor understand within seconds that PHP is a glass manufacturer, and show the product instead of only describing it. It should feel premium and modern, and it must convert visitors into enquiries.

Design principles

1. **Show, don't tell.** Interactive scenes will (colour-changing building and room) carry the story.
2. **White and bright.** A clean white base with the PHP brand teal. Glass effects come from light, gloss and transparency, not from dark backgrounds.
3. **Glossy but light.** Reflections, frosted cards and soft shadows, keep fast to load.
4. **One scroll, one idea.** Each homepage section will have a single message and a single interaction.
5. **Mobile first.** Every interaction must work with a thumb and degrade gracefully.

Homepage

The homepage has four scroll-driven sections below the header. Sections 1 to 3 are tall "sticky" scenes: the visual stays in view while the animation progresses with scroll.

Section 1: Clear glass hero

- **Visual:** a realistic clear glass slab (cut out, transparent background) with a soft aqua gradient behind it.
- **Motion:** the slab slides in as the visitor scrolls; a bright light sweep passes across its face.
- **Text:** a frosted-glass panel on the right fades in. H1 "Best Glass in Bangladesh", one supporting line ("Float glass made in Chattogram by PHP Float Glass Industries Limited, a concern of PHP Family"), and an amber button "Explore our glass".

Section 2: Reflective glass building

- **Visual:** an isometric 3D-style glass building (three connected volumes, roof deck, plaza and trees) on a soft aqua panel.
- **Interaction:** 10 colour chips on the right. Choosing a chip instantly recolours all building glass with a short fade.
- **Text:** H2 "Reflective glass, in 10 shades" plus a short line on heat and glare reduction. Optional facts from the catalogue: 5 to 6 mm thickness, 1500 MT monthly capacity.
- **Motion:** the building rises and fades in as the section enters.

Section 3: Decorative glass room

- **Visual:** an isometric 3D-style living room cutaway. One full wall is decorative glass in three panels with a soft light sweep and light bounce on the floor. The room has windows, sofa, rug, table, lamp and plants.
- **Interaction:** 7 colour chips (photo-texture swatches). Choosing one recolours the whole glass wall.

- **Text:** H2 "A whole wall in decorative glass" plus a short line about feature walls, kitchen splashbacks and partitions.

Section 4: PHP solutions for your interior elegance

- **Visual:** a 3D apartment cutaway showing living area, dining area, kitchen and bedroom.
- **Labels (colour-coded pills with leader lines):** PHP Clear Glass (living-room windows), PHP Decorative glass (dining wall), PHP Gas stove (kitchen island), PHP Reflective Glass (bedroom windows), PHP Mirror (framed mirror in the bedroom), and two PHP Door labels (glass doors on the partitions).
- **Linked colours:** the apartment's decorative wall and reflective windows take the colours chosen in sections 2 and 3.
- **Heading:** "PHP solutions for your interior elegance" with a short supporting line. Labels should link to the matching product pages.

7. Inner pages

Glass page

- Intro heading and one line, then a responsive grid of seven cards, in this order: Clear, Tempered, Reflective, Decorative, Mirror, Soundproof, Insulating.
- Each card uses a cut-out glass picture from the PHP brochure photos on a pale aqua panel.
- Catalogue specs shown on cards: Tempered 4 to 19 mm, up to 90" × 142"; Reflective 5.0 to 6.0 mm, up to 84" × 120"; Insulating 5 to 19 mm, up to 78" × 118". Mirror is silver-coated, copper-backed and double-painted.
- Soundproof glass card: copy and specifications still to be supplied.
- Future: a detail view per glass type with a gallery, spec table and enquiry button.

Aluminium page

- PHP Aluminium logo, heading and short intro.
- Three cards with real profile photographs from the brochure: PHP Silk (0.85 to 1.0 mm), PHP Solid (1.1 to 1.2 mm), PHP Special (1.2 to 1.5 mm).
- Finish dots for Bronze, Silver and Champagne; thickness and hardness shown in a compact spec row.

Special Products page

- Three product blocks: PHP Door, PHP Ladder, PHP Gas Stove, each with a logo badge, product text and a featured image.
- PHP Door and PHP Ladder both use the PHP Aluminium logo. PHP Gas Stove uses its own logo.
- Door: aluminium half and full doors, Cat Door, Zara Door and a large range of printed-glass designs (feature a selection and link to the full catalogue).

- Ladder: household, folding, heavy-duty two-way, single-way extension and two-part extension ladders in silver and gold, 4 ft to 40 ft.
- Gas Stove: Diamond, Super Queen and Prime series with tempered glass tops.

About Us

- Story: PHP Family since 1969, a pioneer of Bangladeshi industry, and PHP Float Glass Industries Limited.
- Factory facts: reflective glass in 10 shades, 1500 MT per month capacity, about 30% of domestic reflective demand.
- Visuals: factory photographs, a timeline strip, and the "Peace, Happiness and Prosperity" message.

Contact Us

- Enquiry form: name, phone or WhatsApp, product interest, message.
- Prominent WhatsApp and call buttons. Address: 40/1 PHP Center, Zakir Hossain Road, Khulshi, Chattogram. Email: glass.info@phpfamily.com.
- Map embed and a dealer locator in a later phase.

Motion and interaction

- Scroll-driven animation on homepage sections 1 to 3 only. Everything else uses simple fades.
- Colour change: a 300 to 400 ms transition on the glass colour.
- Light sweep: a slow diagonal highlight across glass surfaces on entry and hover.
- Respect reduced-motion settings: show final states without scroll animation.
